Forward Problem/Solutions
CMS, Authorize.Net Now Uses Accept Hosted Communication Method (Jira-###)
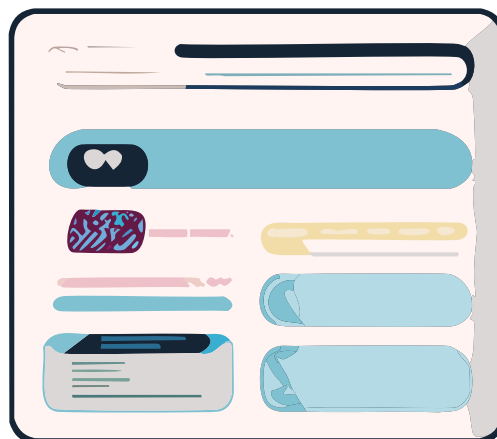

Your Problem:

Authorize.Net has deprecated... their SIM payment process and has strongly recommended moving to their newer ***Accept Hosted*** process. (Migrating an existing solution following the deprecation of a feature is important In order to receive the most up-to-date features and to take advantage of a single, consistent platform.)

Our CMS Solution:

With this release... when your customer fills in and submits the ***Authorize.Net Payment Entry Form***, the transaction is processed; and your customer is returned to your site, which displays a result page based on the followed URL, or the response information sent.

- Once your registrant's payment has processed, a confirmation email is sent to the ***Event Registrant***, as well as to the ***Administrator Contact*** for the ***Event***. The ***Event Registrant*** name also displays within the ***Registrant Report***.

- The ***Event Registrant*** is also notified if the payment is unsuccessful.

For additional information, please see: **http://preauthorize/api/reference/features/xxxx.html**
